POM-C / POM-H

These are virgin copolymer and homopolymer acetal grades. The acetal copolymer is more resistant against hydrolysis, strong alkalis and thermal-oxidative degradation than the acetal homopolymer. The latter, however, has higher mechanical strength, stiffness, hardness and creep resistance as well as a lower thermal expansion rate and often it also presents a better wear resistance.

Main characteristics:

- high mechanical strength, stiffness and hardness
- excellent resilience
- good creep resistance
- high impact strength, even at low temperatures
- very good dimensional stability
- good sliding properties and wear resistance
- excellent machinability
- good electrical insulating and dielectric properties
- physiologically inert (suitable for food contact)
- not self-extinguishing

POM is very well suited for machining on automatic lathes and is particularly recommended for mechanical precision parts.
